

Sepal.Length

A PCA plot showing the separation of three Iris species: *setosa*, *versicolor*, and *virginica*. The x-axis is labeled 'Species' and the y-axis is labeled 'Sepal.Length'. The *setosa* species is represented by black dots and is well-separated from the other two. The *versicolor* and *virginica* species are represented by red dots and are more overlapping, though *virginica* is slightly higher on the y-axis. A blue shaded ellipse encloses the *versicolor* and *virginica* points.

A PCA plot showing the first two principal components (PC1 and PC2) for three species of Iris: setosa, versicolor, and virginica. The x-axis is labeled 'PC1' and the y-axis is labeled 'PC2'. The 'setosa' species is represented by a black dot and is clearly separated from the other two. The 'versicolor' and 'virginica' species are represented by red dots and are clustered together, with some overlap between them. A blue line is drawn through the plot, likely representing a decision boundary or a principal component.

A scatter plot illustrating the distribution of three Iris species: virginica, versicolor, and setosa. The plot is enclosed in a large blue oval labeled "Species". The "virginica" label is at the top, "versicolor" is in the middle, and "setosa" is at the bottom. A red dashed ellipse highlights the "versicolor" and "setosa" clusters, with a red cross and the word "Error" indicating a misclassification.
